

About Us

With more than 50 years experience of chain manufacturing and 30 years overseas market sales, Shinelink Machinery has become expert in the area. We are constantly working to improve our processes and invest in new state-of-art machinery and equipment. We are strategic partner for customers all around the globe, and our engineering-class chains are especially renowned for their reliability and competitive prices.

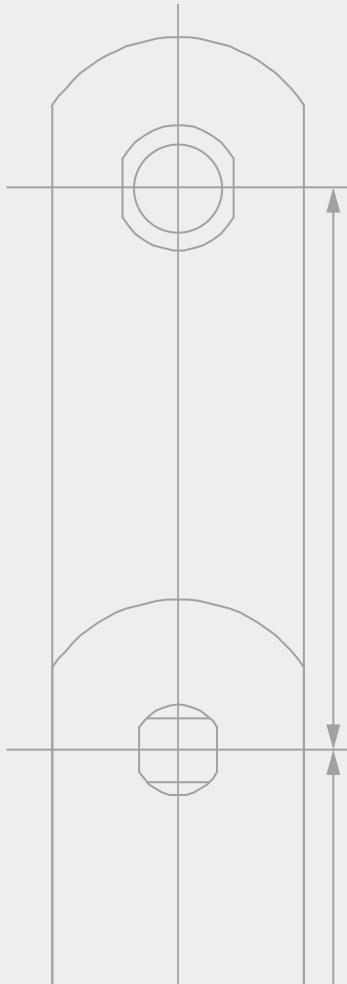

In addition to standard products, we offer all kinds of customization and special designs with our knowledge of current and emerging applications, in order that our customers have their drive and conveying systems function safely and precisely, and get real value from their investment.

We now have also accumulated technology, expertise and resources in designing, manufacturing, and maintaining drive and conveying sub-systems for large-scale projects. In recent years, we have served local developers from Africa,Central Asia and South America with their construction of cement plants,sugar mills and steel plants, improving efficiency and resiliency of the infrastructure.

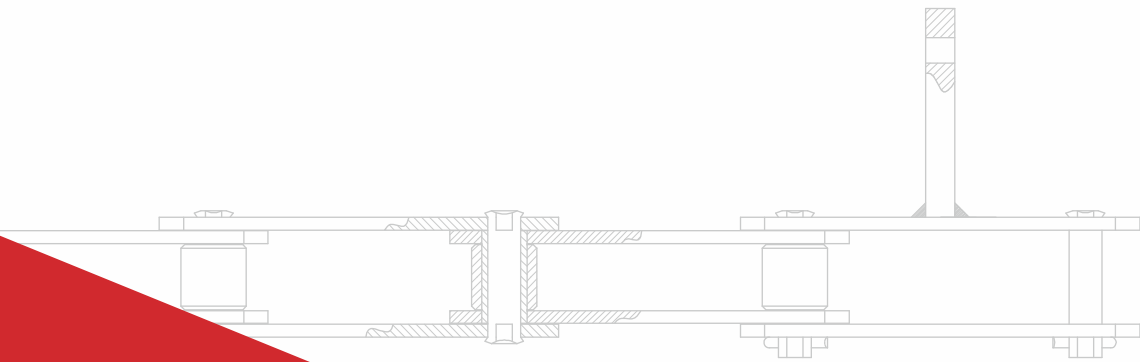

Engineering Class Chain

The engineering class chains are designed for heavy heavy duty applications, where optimum combination of strength,wear, and durability are required. State of the art machinery and equipment guarantee the accurate pitch control for smooth chain and sprocket interaction. Combination of materials are carefully selected of each component, which is machined to close tolerances, and then heat treated to ensure toughness and strength which are extremely important in withstanding high shock loads. Shinelink Machinery delivers consistent,high quality engineering class chains that meet needs of various industrial scenarios and make the best of your investment.

Mining Chain

Mining chain is supplied in diverse specifications to satisfy the demands of mining industry in underground,above ground, and preparation plant applications, and is crucial in the operation of mining machinery such as shuttle cars, bridge conveyors, slat conveyors, wash boxes, feeder breakers, and stacker-reclaimers. The chain is fabricated, heat-treated, and assembled to withstand today' s powerful, highly productive mining equipment.

Sugar Mill Chain

In the processing system of sugar making industry, sugar mill chain is adopted both as drive and conveying mechanism in production steps such as raw material handling, juicing, settling and evaporation. Sugar mill chain has to be resistant to abrasion and corrosion due to its exposure to strong impacts and corrosive environments.

Drop Forged Chain

Drop forged chain is an important component of trolley conveyor and overhead handling systems, whose conveying function is realized through cooperation between chains and trolley attachments. The chain is composed of three forged parts, and can be easily assembled or disassembled by hand. The precise pitch control and smooth bearing areas provide extra consistency and extended wear life.

Casting Chain

Casting chain is manufactured using casting technique, features high resistance and easy fabrication, and can be used in a variety of industrial fields through modifications in its structure, size and material. This versatile chain can be found in sanitation, chemical, paper, and mining industries where a tough, abrasion-resistant, moderate cost chain is needed. The chain is available in special pearlitic malleable iron and alloy steel.

Welded Steel Chain

Side bars and bushings are welded to form such a structure that the chain can withstand strong impact, abrasive objects and dusty environments. Each component is engineered to close tolerances. It can be found lumber mills, sugar mills, and any industry that requires strength and reliability. A variety of attachments are available.

Other Industries Covered

Bulk material handling

Cement Plants

Food industry

Forklifting

Heavy Transmission

Marsh Buggy

Metal Processing

Water Treatment
